

# A quick review of probability theory

[longhuan@sjtu.edu.cn](mailto:longhuan@sjtu.edu.cn)

# Outline

- Events and probability
- Bayes' rule
- Discrete random variables and expectation
- Moments and derivations

# Definition of Probability

- **Experiment:** toss a coin twice
- **Sample space:** possible outcomes of an experiment
  - $\Omega = \{HH, HT, TH, TT\}$
- **Event:** a subset of possible outcomes.
  - $A = \{HH\}$ ,  $B = \{HT, TH\}$
- **Probability of an event:** an number assigned to an event  $\Pr(A)$ 
  - Axiom 1:  $\Pr(A) \geq 0$
  - Axiom 2:  $\Pr(\Omega) = 1$
  - Axiom 3: For every sequence of disjoint events  
 $\Pr(\bigcup_i A_i) = \sum_i \Pr(A_i)$

# Set notations

- $E_1 \cap E_2$  is the event that both  $E_1$  and  $E_2$  happen.
- $E_1 \cup E_2$  for the event that at least one of  $E_1$  and  $E_2$  happen.
- $E_1 - E_2$  for the occurrence of an event that is in  $E_1$  but not in  $E_2$ .
- $\bar{E}$  stands for  $\Omega - E$ .

**Lemma:** for any two events  $E_1$  and  $E_2$ :

$$\Pr(E_1 \cup E_2) = \Pr(E_1) + \Pr(E_2) - \Pr(E_1 \cap E_2)$$

**Proof.** (Inclusion-exclusion principle)

# Union Bound

**Lemma:** For any finite or countably infinite sequence of events  $E_1, E_2, \dots$

$$\Pr\left(\bigcup_{i \geq 1} E_i\right) \leq \sum_{i \geq 1} \Pr(E_i).$$

**Proof.**

# Independence

- Two events  $A$  and  $B$  are **independent** in case

$$\Pr(A \cap B) = \Pr(A) \cdot \Pr(B)$$

- A set of events  $\{A_1, A_2, \dots, A_k\}$  are **mutually independent** iff for any subset  $I \subseteq [1, k]$

$$\Pr\left(\bigcap_{i \in I} A_i\right) = \prod_{i \in I} \Pr(A_i)$$

# Independence

Consider the experiment of tossing a coin twice

- **Example I.**

- $A = \{HT, HH\}, B = \{HT\}$
- Will event  $A$  independent from event  $B$ ?

- **Example II.**

- $A = \{HT\}, B = \{TH\}$
- Will event  $A$  independent from event  $B$ ?

- **Disjoint  $\neq$  Independence**

- If  $A$  is independent from  $B$ ,  $B$  is independent from  $C$ , will  $A$  be independent from  $C$ ?

# Application1: Identify polynomials

$$(x + 1)(x - 2)(x + 3)(x - 4)(x + 5)(x - 6) \\ ? = x^6 - 7x^3 + 25$$

- Generally  $F(x) \neq G(x)$

# Probabilistic algorithm

- Assume  $\text{Max}(\text{Deg}(G(x)), \text{Deg}(F(x))) = d$
- Algorithm
  - Choose an integer  $r$  uniformly at random in the range  $\{1, \dots, 100d\}$
  - Compute  $F(r)$  and  $G(r)$
  - If  $F(r) = G(r)$  output **Yes**;  
otherwise, output **No**.

# Analysis

- $E$ : The event that the algorithm **fails**.
- The algorithm may fail iff
  - $F(x) \neq G(x)$  and  $F(r) = G(r)$
  - $r$  is the solution of  $H(x) = F(x) - G(x) = 0$ .
  - $H(x)$  has at most  $d$  solutions.
- $\Pr(E) \leq \frac{d}{100d} = \frac{1}{100}$
- **Idea** : If it keeps returning (Yes), we repeat the algorithm for  $k$  times.
  - The updated algorithm will fail iff every  $E_i$  fails for  $1 \leq i \leq k$ .

For  $i = 1$  to  $k$  do

- Choose an integer  $r$  uniformly at random in the range  $\{1, \dots, 100d\}$
- Compute  $F(r)$  and  $G(r)$
- If  $F(r) = G(r)$  return **Yes**;  
otherwise stop and output **No**.

$$\begin{aligned} \bullet \Pr(E) &= \Pr(E_1 \cap E_2 \cap \dots \cap E_k) \\ &= \Pr(E_1) \cdot \Pr(E_2) \cdot \dots \cdot \Pr(E_k) \\ &\leq \left(\frac{1}{100}\right)^k \end{aligned}$$

# Conditioning

- If  $E$  and  $F$  are events with  $\Pr(F) > 0$ , the **conditional probability of  $E$  given  $F$**  is

$$\Pr(E|F) = \frac{\Pr(E \cap F)}{\Pr(F)}$$

- If  $E$  and  $F$  are independent

$$\Pr(E|F) = \frac{\Pr(E \cap F)}{\Pr(F)} = \frac{\Pr(E) \Pr(F)}{\Pr(F)} = \Pr(E)$$

# Application

- Example: Drug test

	Women	Men
Success	200	1800
Failure	1800	200

$A = \{\text{Patient is a Women}\}$

$B = \{\text{Drug fails}\}$

$\Pr(B|A) = ?$

$\Pr(A|B) = ?$

# Application 2: Monty Hall problem

- Suppose you're on a game show, and you're given the choice of three doors: Behind one door is a car; behind the others, goats. You pick a door, say No. 1, and the host, who knows what's behind the doors, opens another door, say No. 3, which has a goat. He then says to you, "Do you want to pick door No. 2?" Is it to your advantage to switch your choice?

Behind door 1	Behind door 2	Behind door 3	Result if staying at door #1	Result if switching to the door offered
Car	Goat	Goat	Wins car	Wins goat
Goat	Car	Goat	Wins goat	Wins car
Goat	Goat	Car	Wins goat	Wins car

# Tuesday boy problem

- “I have two children. One is a boy born on a Tuesday. What is the probability I have two boys?”

<BTU, girl> 7

<girl, BTU> 7

<BTU, boy> 7

<boy, BTU> 7-1= 6

---

$$(7+6)/(7+7+7+6)=13/27$$

# Drug Evaluation

	Women		Men	
	Drug I	Drug II	Drug I	Drug II
Success	200	10	19	1000
Failure	1800	190	1	1000

# Simpson's Paradox: View I

	Women		Men	
	Drug I	Drug II	Drug I	Drug II
Success	200	10	19	1000
Failure	1800	190	1	1000

**Drug II is better than Drug I**

	Drug I	Drug II
Success	219	1010
Failure	1801	1190

$A = \{\text{Using Drug I}\}$

$B = \{\text{Using Drug II}\}$

$C = \{\text{Drug succeeds}\}$

$\Pr(C|A) = 219/2020 \sim 10\%$

$\Pr(C|B) = 1010/2200 \sim \mathbf{50\%}$

# Simpson's Paradox: View II

	Women		Men	
	Drug I	Drug II	Drug I	Drug II
Success	200	10	19	1000
Failure	1800	190	1	1000

**Drug I is better than Drug II**

## Female Patient

$A = \{\text{Using Drug I}\}$

$B = \{\text{Using Drug II}\}$

$C = \{\text{Drug succeeds}\}$

$\Pr(C|A) \sim 10\%$

$\Pr(C|B) \sim 5\%$

## Male Patient

$A = \{\text{Using Drug I}\}$

$B = \{\text{Using Drug II}\}$

$C = \{\text{Drug succeeds}\}$

$\Pr(C|A) \sim 100\%$

$\Pr(C|B) \sim 50\%$

## Another version: Berkeley gender bias case (1973)

	Applicants	Admitted

[Simpson's paradox - Wikipedia](#)

# Vector interpretation of Simpson's paradox

[Simpson's paradox - Wikipedia](#)

A real-life example from a medical study comparing the success rates of two treatments for kidney stones.

	Treatment A	Treatment B
Small Stones	Group 1 <b>93%</b> (81/87)	Group 2 87% (234/270)
Large Stones	Group 3 <b>73%</b> (192/263)	Group 4 69% (55/80)
Both	78% (273/350)	<b>83%</b> (289/350)

Vector representation in which each vector's slope denotes its success rate.

[Simpson's paradox - Wikipedia](https://en.wikipedia.org/wiki/Simpson's_paradox)

# Law of total probability

- Let  $E_1, E_2, \dots, E_n$  be mutually disjoint events in the sample space  $\Omega$ , and let  $\bigcup_{i=1}^n E_i = \Omega$ , then

$$\begin{aligned}\Pr(B) &= \sum_{i=1}^n \Pr(B \cap E_i) \\ &= \sum_{i=1}^n \Pr(B|E_i) \Pr(E_i)\end{aligned}$$

# Conditional Independence

- Event  $A$  and  $B$  are ***conditionally independent given  $C$***  in case

$$\Pr(A \cap B|C) = \Pr(A|C) \cdot \Pr(B|C)$$

Or equivalently,

$$\Pr(A|B \cap C) = \Pr(A|C)$$

- Example: There are three events:  $A, B, C$ 
  - $\Pr(A) = \Pr(B) = \Pr(C) = \frac{1}{5}$
  - $\Pr(A \cap C) = \Pr(B \cap C) = \frac{1}{25}, \Pr(A \cap B) = \frac{1}{10}$
  - $\Pr(A \cap B \cap C) = \frac{1}{125}$
  - Whether  $A, B$  are conditionally independent given  $C$ ?
  - Whether  $A, B$  are independent?

- Example: There are three events:  $A, B, C$ 
  - $\Pr(A) = \Pr(B) = \Pr(C) = \frac{1}{5}$
  - $\Pr(A \cap C) = \Pr(B \cap C) = \frac{1}{25}, \Pr(A \cap B) = \frac{1}{10}$
  - $\Pr(A \cap B \cap C) = \frac{1}{125}$
  - Whether  $A, B$  are conditionally independent given  $C$ ? **Yes**
  - Whether  $A, B$  are independent? **No**

- A box contains two coins: a regular coin and one fake two-headed coin ( $P(H) = 1$ ). One chooses a coin at random and toss it twice. Define the following events.
  - $A$  = First coin toss results in an  $H$
  - $B$  = Second coin toss results in an  $H$
  - $C$  = Coin 1 (regular) has been selected.
- $P(A \cap B) = 5/8 \neq P(A)P(B) = 9/16$  , which means that  $A$  and  $B$  are not independent.
- Given  $C$  (Coin 1 is selected),  $A$  and  $B$  are independent.

Conditional independence neither implies (nor is it implied by) independence.

# Outline

- Events and probability
- Bayes' rule
- Discrete random variables and expectation
- Moments and derivations

# Bayes' Rule

- Given two events  $A$  and  $B$  and suppose that  $\Pr(A) > 0$ . Then

$$\Pr(B | A) = \frac{\Pr(AB)}{\Pr(A)} = \frac{\Pr(A | B) \Pr(B)}{\Pr(A)}$$

- Example:

$\Pr(W R)$	R	$\neg R$
W	0.7	0.4
$\neg W$	0.3	0.6

R: It is a rainy day

W: The grass is wet

$\Pr(R|W) = ?$

$$\Pr(R) = 0.8$$

# Bayes' Rule

	R	$\neg R$
W	0.7	0.4
$\neg W$	0.3	0.6

R: It rains

W: The grass is wet

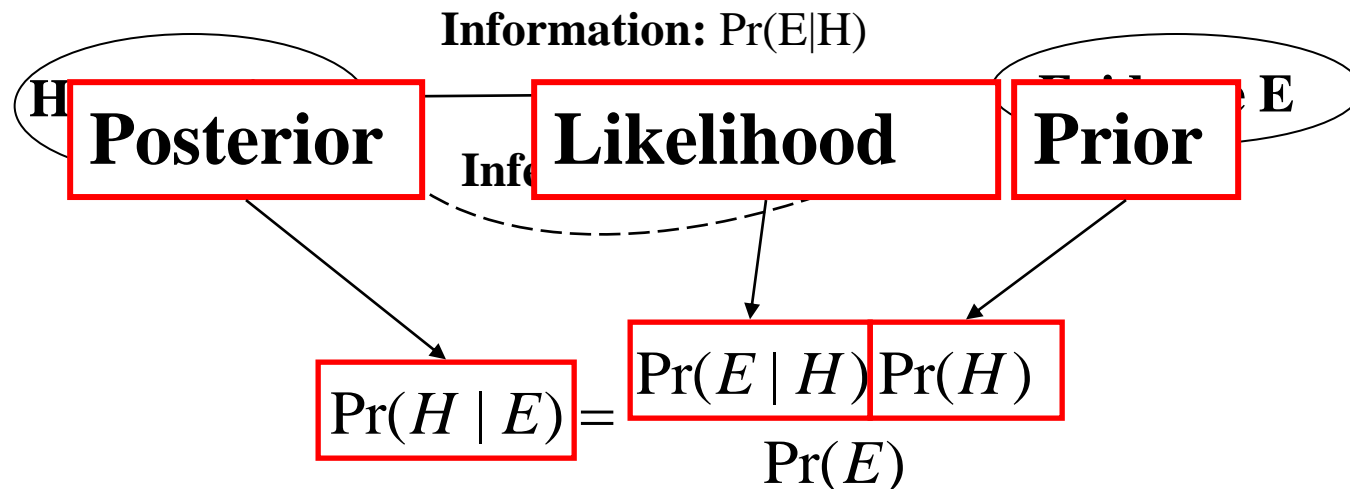

# Bayes' Rule

	R	$\neg R$
W	0.7	0.4
$\neg W$	0.3	0.6

R: It rains

W: The grass is wet

# Bayes' Rule: More Complicated

Suppose that  $B_1, B_2, \dots, B_k$  form a partition of  $S$ :

$$B_i \cap B_j = \emptyset; \quad \bigcup_i B_i = S$$

Suppose that  $\Pr(B_i) > 0$  and  $\Pr(A) > 0$ . Then

$$\Pr(B_i | A) = \frac{\Pr(A | B_i) \Pr(B_i)}{\Pr(A)}$$

# Bayes' Rule: More Complicated

Suppose that  $B_1, B_2, \dots, B_k$  form a partition of  $S$ :

$$B_i \cap B_j = \emptyset; \quad \bigcup_i B_i = S$$

Suppose that  $\Pr(B_i) > 0$  and  $\Pr(A) > 0$ . Then

$$\begin{aligned} \Pr(B_i | A) &= \frac{\Pr(A | B_i) \Pr(B_i)}{\Pr(A)} \\ &= \frac{\Pr(A | B_i) \Pr(B_i)}{\sum_{j=1}^k \Pr(AB_j)} \end{aligned}$$

# Bayes' Rule: More Complicated

Suppose that  $B_1, B_2, \dots, B_k$  form a partition of  $S$ :

$$B_i \cap B_j = \emptyset; \quad \bigcup_i B_i = S$$

Suppose that  $\Pr(B_i) > 0$  and  $\Pr(A) > 0$ . Then

$$\begin{aligned} \Pr(B_i | A) &= \frac{\Pr(A | B_i) \Pr(B_i)}{\Pr(A)} \\ &= \frac{\Pr(A | B_i) \Pr(B_i)}{\sum_{j=1}^k \Pr(AB_j)} \\ &= \frac{\Pr(A | B_i) \Pr(B_i)}{\sum_{j=1}^k \Pr(B_j) \Pr(A | B_j)} \end{aligned}$$

# In all

Assume that  $E_1, E_2, \dots, E_n$  are mutually disjoint sets such that  $\bigcup_{i=1}^n E_i = E$ , then

$$\begin{aligned}\Pr(E_j|B) &= \frac{\Pr(E_j \cap B)}{\Pr(B)} \\ &= \frac{\Pr(B|E_j)\Pr(E_j)}{\sum_{i=1}^n \Pr(B|E_i)\Pr(E_i)}\end{aligned}$$

# Example

$E_i$ : the  $i^{th}$  coin is the biased one.

$B$ :  $HHT$

$$\Pr(B|E_1) = \Pr(B|E_2) \\ = \left(\frac{2}{3}\right) \cdot \left(\frac{1}{2}\right) \cdot \left(\frac{1}{2}\right) = \frac{1}{6}$$

$$\Pr(B|E_3) = \left(\frac{1}{2}\right) \cdot \left(\frac{1}{2}\right) \cdot \left(\frac{1}{3}\right) = \frac{1}{12}$$

$$\Pr(E_i) = \frac{1}{3}$$

$$\Pr(E_1 | B) = \frac{2/5 = \frac{(1/6)(1/3)}{2(1/6)(1/3) + (1/12)(1/3)}}$$

- We have three coins
  - Two of them: fair
  - The other one:  $\Pr(H) = 2/3$
- Flip **them** we get:  $HHT$
- Problem: What is the probability that the **first** coin is the biased one?

# A More Complicated Example

<b>R</b>	It rains
<b>W</b>	The grass is wet
<b>U</b>	People bring umbrella

# A More Complicated Example

**R**      It rains

**W**      The grass is wet

**U**      People bring umbrella

$$\Pr(UW|R) = \Pr(U|R)\Pr(W|R)$$

$$\Pr(UW|\neg R) = \Pr(U|\neg R)\Pr(W|\neg R)$$

# A More Complicated Example

$$\Pr(R) = 0.8$$

**R** It rains

**W** The grass is wet

**U** People bring umbrella

$$\Pr(UW|R) = \Pr(U|R)\Pr(W|R)$$

$$\Pr(UW|\neg R) = \Pr(U|\neg R)\Pr(W|\neg R)$$

$\Pr(W R)$	R	$\neg R$
W	0.7	0.4
$\neg W$	0.3	0.6

$\Pr(U R)$	R	$\neg R$
U	0.9	0.2
$\neg U$	0.1	0.8

$$\Pr(U|W) = ?$$

# Outline

- Events and probability
- Bayes' rule
- Discrete random variables and expectation
- Moments and derivations
- The probabilistic method

# Random Variable and Distribution

- A **random variable  $X$**  is a numerical outcomes of a random experiment

$$X: \Omega \rightarrow R$$

- The **distribution** of a random variable is the collection of possible outcomes along with their probabilities:

– Discrete case:

$$\Pr(X = a) = \sum_{s \in \Omega, X(s)=a} \Pr(s)$$

# Random Variable: Example

- Let  $S$  be the set of all sequences of two rolls of a die. Let  $X$  be the sum of the number of dots on the two rolls.
- The event  $X = 4$  corresponds to the set of basic *events*  $\{(1,3), (2,2), (3,1)\}$ . Hence

$$\Pr(X = 4) = \frac{3}{36} = \frac{1}{12}$$

# Independent random variable

- Two random variables  $X$  and  $Y$  are independent if and only if

$$\Pr((X = x) \cap (Y = y)) = \Pr(X = x) \cdot \Pr(Y = y)$$

# Expectation

- A basic characteristic of a random variable is **expectation**.
- The expectation of a random variable is a **weighted average** of the values it assumes, where each value is weighted by the probability that the variable assumes that value.

# Expectation

- A random variable  $X \sim \Pr(X = x)$ . Then, its **expectation** is

$$E[X] = \sum_x x \Pr(X = x)$$

- In an empirical sample,  $x_1, x_2, \dots, x_N$ ,

$$E[X] = \frac{1}{N} \sum_{i=1}^N x_i$$

# Examples

- The expectation of the random variable  $X$  representing the sum of two dice is

$$E(X) = \frac{1}{36} \cdot 2 + \frac{2}{36} \cdot 3 + \frac{3}{36} \cdot 4 + \cdots + \frac{1}{36} \cdot 12 = 7$$

# Examples

- The expectation of the random variable  $X$  representing the sum of two dice is

$$E(X) = \frac{1}{36} \cdot 2 + \frac{2}{36} \cdot 3 + \frac{3}{36} \cdot 4 + \cdots + \frac{1}{36} \cdot 12 = 7$$

- A random variable  $X$  that takes on the value  $2^i$  with probability  $1/2^i$  for  $i=1,2,\dots$

$$E(X) = \sum_{i=1}^{\infty} \frac{1}{2^i} 2^i = \sum_{i=1}^{\infty} 1 = \infty$$

# Linearity of expectations

- Expectation of sum of random variables

$$E(X) + E(Y) = E(X + Y)$$

Proof.

- Generally: For any finite collection of discrete random variables  $X_1, X_2, \dots, X_n$  with finite expectations.

$$E \left[ \sum_{i=1}^n X_i \right] = \sum_{i=1}^n E[X_i]$$

# Example

- Recall: The expected sum of two dice.

***Solution:***

Let  $X = X_1 + X_2$

where  $X_i$  represents the outcome of dice  $i$  for  $i = 1, 2$ . Then

$$E(X_i) = \frac{1}{6} \sum_{j=1}^6 j = \frac{7}{2}$$

$$E(X) = E(X_1) + E(X_2) = 7$$

# Lemma

For any constant  $c$  and discrete random variable  $X$

$$E[cX] = c \cdot E[X]$$

Proof.

$$\begin{aligned} E[cX] &= \sum_j j \cdot \Pr(cX = j) \\ &= c \sum_j (j/c) \cdot \Pr(X = j/c) \\ &= c \sum_k k \cdot \Pr(X = k) \\ &= c \cdot E[X] \end{aligned}$$

# Variance

- The **variance** of a random variable  $X$  is the expectation of  $(X - E[X])^2$  :

$$\begin{aligned} \text{Var}(X) &= E((X - E[X])^2) \\ &= E(X^2 + E[X]^2 - 2XE[X]) \\ &= E(X^2 - E[X]^2) \\ &= E[X^2] - E[X]^2 \end{aligned}$$

# Bernoulli Distribution

- The outcome of an experiment can either be success (i.e., 1) and failure (i.e., 0).
- $\Pr(X = 1) = p, \Pr(X = 0) = 1 - p$
- $E[X] = p, \text{Var}(X) = p(1 - p)$

# Binomial Distribution

- Consider a sequence of  $n$  independent coin flips. What is the distribution of the number of heads in the entire sequence?
- $n$  draws of a Bernoulli distribution.  $X$  stands for the **number of successes** in these experiments.
- Random variable  $X$  stands for the number of times that experiments are successful.

$$\Pr(X = x) = p_{\theta}(x) = \begin{cases} \binom{n}{x} p^x (1-p)^{n-x} & x = 1, 2, \dots, n \\ 0 & \text{otherwise} \end{cases}$$

- $E[X] = np$  (by linearity),  $Var(X) = np(1-p)$

# Geometric Distribution

- Suppose that we flip a coin *until* it lands on heads. What is the distribution of the number of flips?
- A geometric random variable  $X$  with parameter  $p$  is given by the following probability distribution on  $n=1,2,\dots$ :

$$\Pr(X = n) = (1 - p)^{n-1}p$$

# Memoryless

- Geometric random variables are said to be *memoryless*: the probability that you will reach your first success  $n$  trials from now is independent of the number of failures you have experienced.
- Formally,
$$\Pr(X = n + k \mid X > k) = \Pr(X = n)$$

# Proof.

$$\begin{aligned}\Pr(X = n + k \mid X > k) &= \frac{\Pr((X = n + k) \cap (X > k))}{\Pr(X > k)} \\&= \frac{\Pr(X = n + k)}{\Pr(X > k)} \\&= \frac{(1 - p)^{n+k-1}p}{\sum_{i=k}^{\infty} (1 - p)^i p} \\&= \frac{(1-p)^{n+k-1}p}{(1-p)^k} \\&= (1 - p)^{n-1}p \\&= \Pr(X = n)\end{aligned}$$

# Expectation

- Method 1: make use of the definitions.
- Method 2:

$$E[X] = p \cdot 1 + (1 - p) \cdot (E[X] + 1)$$

$$p \cdot E[X] = 1$$

$$E[X] = 1/p$$

$$Var[X] = (1 - p)/p^2$$

# Application: Coupon Collector's Problem

- ❖ Each box of cereal contains one of  $n$  different coupons.
- ❖ Once you obtain one of every type of coupon, you can send in for a prize.
- ❖ Coupons are distributed independently and uniformly at random from the  $n$  possibilities.
- ❖ **Question:** How many boxes of cereal must you buy before you obtain at least one of every type of coupon?

# Solution

- Let  $X$  be the number of boxes bought until at least one of every type of coupon is obtained.
- $X_i$  is the number of boxes bought while you had exactly  $i-1$  different coupons.
- Clearly,  $X = \sum_{1 \leq i \leq n} X_i$
- $X_i$  is a geometric random variable:
  - When exactly  $i - 1$  coupons have been found, the probability of obtaining a **new** coupon is  $p_i = 1 - \frac{i-1}{n}$
  - $E[X_i] = \frac{1}{p_i} = \frac{n}{n-i+1}$
- By the linearity of expectations, we have

$$\begin{aligned} E[X] &= E\left[\sum_{1 \leq i \leq n} X_i\right] = \sum_{1 \leq i \leq n} E[X_i] = \sum_{1 \leq i \leq n} \frac{n}{n-i+1} = n \cdot \sum_{1 \leq i \leq n} \left(\frac{1}{i}\right) \\ &= n \cdot \ln n + \Theta(n) \end{aligned}$$

(Where  $\sum_{1 \leq i \leq n} \left(\frac{1}{i}\right) = H(n) = \Theta(\ln n)$  *harmonic number*)

$$\text{Var}(X) = \text{Var}(X_1 + \cdots X_n)$$

$$p_i = 1 - \frac{i-1}{n}$$

$$= \text{Var}(X_1) + \cdots + \text{Var}(X_n)$$

$$= \frac{1 - p_1}{p_1^2} + \cdots + \frac{1 - p_n}{p_n^2}$$

$$< \left( \frac{n^2}{n^2} + \frac{n^2}{(n-1)^2} + \cdots \frac{n^2}{1} \right)$$

$$= n^2 \cdot \left( \frac{1}{1^2} + \frac{1}{2^2} + \cdots \frac{1}{n^2} \right)$$

$$< \frac{\pi^2}{6} n^2$$

# Outline

- Events and probability
- Bayes' rule
- Discrete random variables and expectation
- Moments and derivations

# Markov's Inequality

- Let  $X$  be a random variable that assumes only nonnegative values. Then for all  $a > 0$

$$\Pr(X \geq a) \leq \frac{E[X]}{a}$$

- Proof.

# Example

- Bound the probability of obtaining more than  $\frac{3n}{4}$  heads in a sequence of  $n$  fair coin flips. Let  $X_i = 1$  if the  $i^{th}$  coin flip is head, otherwise,  $X_i = 0$ .
  - Let  $X = \sum_{1 \leq i \leq n} X_i$ . It follows that  $E[X] = \frac{n}{2}$
  - $\Pr\left(X \geq \frac{3n}{4}\right) \leq \frac{E[X]}{\frac{3n}{4}} = 2/3$

# Chebyshev's Inequality

- For any  $a > 0$ ,

$$\Pr(|X - E(X)| \geq a) \leq \frac{\text{Var}[X]}{a^2}$$

- Proof.

# Example: Coupon Collector's Problem

Recall:  $E[X] = n \cdot Hn$

By Markov's inequality:

$$\Pr(X \geq 2n \cdot Hn) \leq 1/2$$

By Chebyshev's inequality, this can be improved to

$$\Pr(X \geq 2n \cdot Hn) \leq O\left(\frac{1}{(\ln n)^2}\right)$$

# Union bound

- After unpacking  $2n \cdot Hn$  cereals, the probability that the  $i$ th card has not shown is

$$\Pr(\text{no card } i \text{ after } 2n \cdot Hn \text{ step}) = \left(1 - \frac{1}{n}\right)^{2n \cdot Hn}$$

- The probability that we do not get the whole set of  $n$  cards after step is:

$$\begin{aligned} \Pr(X > 2n \cdot Hn) &\leq n \cdot \left(1 - \frac{1}{n}\right)^{2n \cdot Hn} \\ &\leq n \cdot e^{-2 \cdot Hn} = O(1/n) \end{aligned}$$

- $\Pr(X \geq 2n \cdot Hn) \leq \frac{1}{2}$  Markov
- $\Pr(X \geq 2n \cdot Hn) \leq O\left(\frac{1}{(\ln n)^2}\right)$  Chebyshev
- $\Pr(X > 2n \cdot Hn) \leq O\left(\frac{1}{n}\right)$  Union Bound

Chebyshev also gives (weak) lower bound. Using more advanced tools one can show

- $\Pr(X \leq (1 - \epsilon)(n - 1) \ln n) \leq e^{-n^\epsilon}$

# Chernoff Bound-style

$$\Pr(X \geq a) = \Pr(e^{tX} \geq e^{t \cdot a}) \text{ for any } t > 0$$

$$\leq \frac{E(e^{tX})}{e^{t \cdot a}}$$

$$\leq \min_{t>0} \frac{E(e^{tX})}{e^{t \cdot a}}$$

# Conditional Expectation

- $X$  is a discrete random variable, and  $E$  is an event with  $P(E) > 0$ . The conditional expectation of  $X$  conditioned on  $E$  is

$$E[X|E] \triangleq \sum_{x \in \text{Ran}(X)} x \cdot P[X = x|E]$$

- Let  $Y$  be another discrete random variable. The conditional expectation of  $X$  conditioned on  $Y$ , written as  $E[X|Y]$ , is a random variable of  $E[X|Y = y]$ .

# Conditional Expectation

- $X$  is a discrete random variable, and  $E$  is an event with  $P(E) > 0$ . The conditional expectation of  $X$  conditioned on  $E$  is

$$E[X|E] \triangleq \sum_{x \in \text{Ran}(X)} x \cdot P[X = x|E]$$

- Let  $Y$  be another discrete random variable. The conditional expectation of  $X$  conditioned on  $Y$ , written as  $E[X|Y]$ , is a random variable of  $E[X|Y = y]$ .

- Proposition:  $E[E[X|Y]] = E[X]$ .

# Conditional Expectation

- Proposition:  $E[E[X|Y]] = E[X]$ .

- Proof.

$$= \sum_y \Pr[Y = y] \cdot E[X|Y = y]$$

$$= \sum_y \Pr[Y = y] \cdot \sum_x x \cdot \Pr[X = x|Y = y]$$

$$= \sum_y \Pr[Y = y] \cdot \sum_x x \cdot \frac{\Pr[X=x \cap Y=y]}{\Pr[Y=y]}$$

$$= \sum_y \sum_x x \cdot \Pr[X = x \cap Y = y]$$

$$= \sum_x x \sum_y \Pr[X = x \cap Y = y]$$

$$= \sum_x x \cdot \Pr[X = x]$$

$$= E[X]$$

# Proof of Chernoff bounds (1)

- Let  $X_1, \dots, X_n$  be independent random variables such that  $X_i \sim \text{Ber}(p_i)$  for each  $i = 1, 2, \dots, n$ . Let  $X = \sum_{i=1}^n X_i$  and denote  $\mu = E[X]$ , then  $\Pr(X \geq (1 + \delta)\mu) \leq \left(\frac{e^\delta}{(1+\delta)^{1+\delta}}\right)^\mu$

If  $0 < \delta < 1$ , then  $\Pr(X \leq (1 - \delta)\mu) \leq \left(\frac{e^{-\delta}}{(1-\delta)^{1-\delta}}\right)^\mu$ .

$$\begin{aligned} M_{X_i}(t) &= E[e^{tX_i}] \\ &= p_i e^t + (1 - p_i) \\ &= 1 + p_i(e^t - 1) \\ &\leq e^{p_i(e^t - 1)} \end{aligned}$$

$$\begin{aligned} M_X(t) &= \prod_{i=1}^n M_{X_i}(t) \\ &\leq \prod_{i=1}^n e^{p_i(e^t - 1)} \\ &= \exp \left\{ \sum_{i=1}^n p_i(e^t - 1) \right\} \\ &= e^{(e^t - 1)\mu} \end{aligned}$$

# Proof of Chernoff bounds (2)

- Let  $X_1, \dots, X_n$  be independent random variables such that  $X_i \sim \text{Ber}(p_i)$  for each  $i = 1, 2, \dots, n$ . Let  $X = \sum_{i=1}^n X_i$  and denote  $\mu = E[X]$ , then  $\Pr(X \geq (1 + \delta)\mu) \leq \left(\frac{e^\delta}{(1+\delta)^{1+\delta}}\right)^\mu$

If  $0 < \delta < 1$ , then  $\Pr(X \leq (1 - \delta)\mu) \leq \left(\frac{e^{-\delta}}{(1-\delta)^{1-\delta}}\right)^\mu$ .

$$\Pr(X \geq (1 + \delta)\mu) = \Pr(e^{tX} \geq e^{t(1+\delta)\mu}) \text{ for any } t > 0$$

$$\leq \frac{E(e^{tX})}{e^{t(1+\delta)\mu}}$$

$$\leq \frac{e^{(e^t-1)\mu}}{e^{t(1+\delta)\mu}} \text{ for any } \delta > 0$$

$$\leq \left(\frac{e^\delta}{(1 + \delta)^{1+\delta}}\right)^\mu \text{ set } t = \ln(1 + \delta) > 0$$

# Proof of Chernoff bounds (3)

- Let  $X_1, \dots, X_n$  be independent random variables such that  $X_i \sim \text{Ber}(p_i)$  for each  $i = 1, 2, \dots, n$ . Let  $X = \sum_{i=1}^n X_i$  and denote  $\mu = E[X]$ , then  $\Pr(X \geq (1 + \delta)\mu) \leq \left(\frac{e^\delta}{(1+\delta)^{1+\delta}}\right)^\mu$

If  $0 < \delta < 1$ , then  $\Pr(X \leq (1 - \delta)\mu) \leq \left(\frac{e^{-\delta}}{(1-\delta)^{1-\delta}}\right)^\mu$ .

$$\Pr(X \leq (1 - \delta)\mu) = \Pr(e^{tX} \geq e^{t(1-\delta)\mu}), \text{ for any } t < 0$$

$$\begin{aligned} &\leq \frac{E(e^{tX})}{e^{t(1-\delta)\mu}} \\ &\leq \frac{e^{(e^t-1)\mu}}{e^{t(1-\delta)\mu}} \quad \text{for any } 0 < \delta < 1 \\ &\leq \left(\frac{e^{-\delta}}{(1-\delta)^{1-\delta}}\right)^\mu \quad \text{set } t = \ln(1 - \delta) < 0 \end{aligned}$$
